

Week 1 project report

AI Travel Concierge

1. Introduction

In Week 1, our team started working on an AI-powered Travel Itinerary Planner for India. The goal of this project is to build a smart travel assistant that generates personalized travel plans based on user preferences such as budget, weather, and trip duration.

The system will focus on the top 50 tourist cities in India and provide day-wise itinerary suggestions with estimated costs.

2. Project Objective

The main objectives of the project are:

- Suggest destinations based on budget
- Consider seasonal and weather conditions
- Recommend major attractions
- Provide approximate daily cost estimates
- Generate 2–5 day travel itineraries

To ensure proper implementation within 8 weeks, we limited the scope to India only.

3. Research and Planning

As we are building an AI-based system, Week 1 was mainly dedicated to learning core concepts.

We are studying:

- Basics of Artificial Intelligence
- Large Language Models (LLMs)
- What is Agentic AI
- Retrieval-Augmented Generation (RAG)
- Embeddings and Vector Databases
- API integration basics

We referred to online tutorials, documentation, and videos to understand how AI agents work and how they can be used for travel planning.

4. Team Role Distribution

Swastika – Data collection

Tanvi – GitHub repository

Ankita – API keys

5. Plan for Week 2

- Expand dataset to 15–20 cities
- Implement embeddings and vector database

6. Conclusion

Week 1 focused on research, and planning. We established a clear roadmap, and began structured data preparation. This foundation will support smooth implementation in the coming weeks.
